Follow us :    

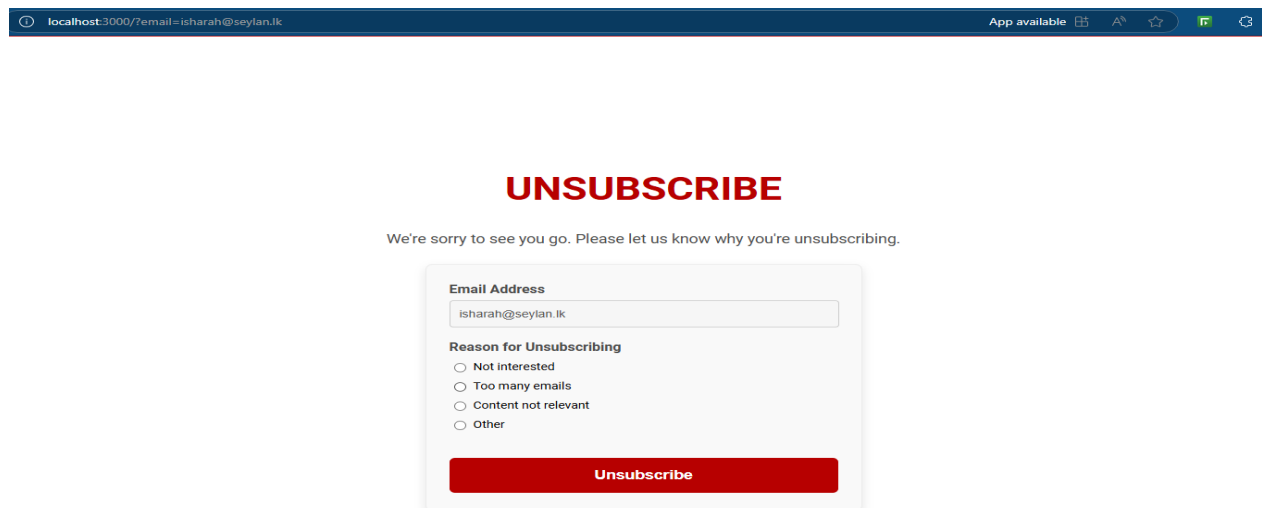

If you no longer wish to receive these emails, you can [Unsubscribe](#)

Purpose:

In the screenshot, there is an 'Unsubscribe' section where users can opt out of receiving promotional emails. When a user clicks the unsubscribe link, they are redirected to a webpage, and their email address is sent to the link as an attached variable.

2. Unsubscribe webpage

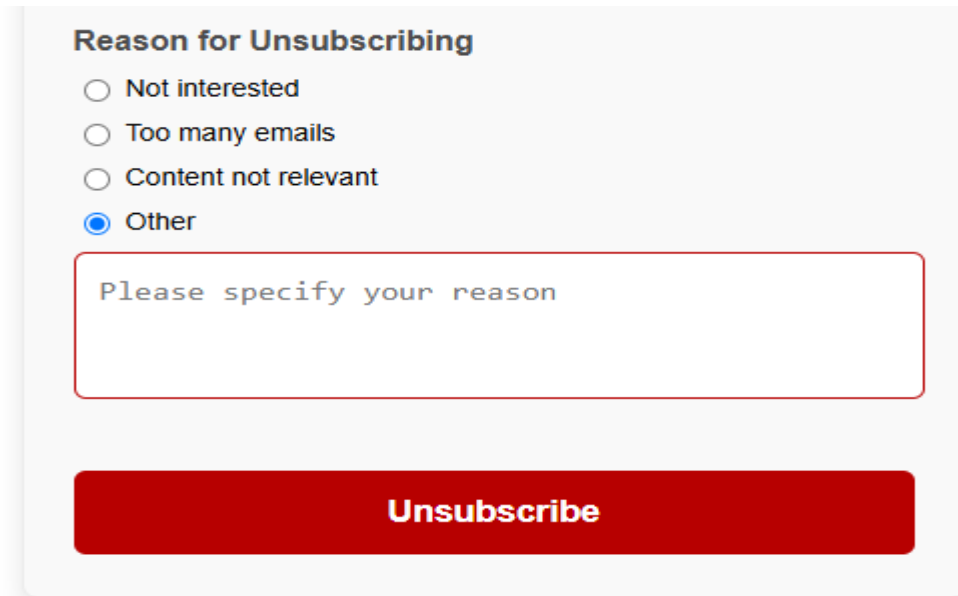

The screenshot shows a web browser window with the address bar displaying "localhost:3000/?email=isharah@seylan.lk". The page has a dark blue header with "App available" and various icons. The main content area has a white background with a red "UNSUBSCRIBE" heading. Below the heading is a message: "We're sorry to see you go. Please let us know why you're unsubscribing." A light gray form box contains an "Email Address" field with the value "isharah@seylan.lk". Below this is a "Reason for Unsubscribing" section with four radio button options: "Not interested", "Too many emails", "Content not relevant", and "Other". At the bottom of the form is a red "Unsubscribe" button.

Purpose:

As shown in the provided screenshot, users are redirected to a webpage where they can unsubscribe

from receiving emails. Their email address is pre-filled in the email address input field. Below this, users can provide a reason for unsubscribing. If the desired reason is not listed among the radio button options, they can select the "Other" option, which reveals an input box where they can enter their reason.

The form is titled "Reason for Unsubscribing" and contains four radio button options: "Not interested", "Too many emails", "Content not relevant", and "Other". The "Other" option is selected. Below the radio buttons is a text input field with the placeholder text "Please specify your reason". At the bottom of the form is a red button labeled "Unsubscribe".

3. Implementation

Frontend Development:

The frontend of the application is built using ReactJS. The Axios library is used for server communication. The email address passed in the link is retrieved using the useLocation module from react-router-dom.

Backend Development:

The backend is developed using ASP.NET Core Web API.

Database Connectivity:

The application uses SQL Server 2022 as its database.
